

Dry ice blasting has become the fastest growing application of CO2 in the entire industry. Similar to sand blasting, dry ice blasting uses a jet nozzle and compressed air to shoot small pellets of dry ice (blasting rice) with superior results. The extreme cold causes targeted material to shrink, allowing for easier removal. The used blasting rice will sublime into gaseous CO2 after use which makes cleanup a breeze.

A Picture Says a Thousand Words

Our before and after pictures speak volumes about Dry Ice Blasting. Our cleaning solutions are effective, environmentally friendly and the best cleaning method for sensitive work environments not suitable for traditional cleaning methods.

We provide dry ice blasting services from areas such as Edmonton, Fort McMurray, Calgary and any location within Alberta and British Columbia.

Our ability to offer quality services is due to our state of the art equipment, highly trained personnel and outstanding customer service.

This oilfield shack was dry ice blasted & painted by Carmad and is just one of many completed with little to no downtime.
